

BULLETIN NUMBER GT565, 5 NOVEMBER 1992

Speedquery version 3.0H available now

Speedquery version 3.0H is now available. This is a bug-fixing release. The following are the significant bugs which have been fixed:

- Labels were being truncated when executed directly;
- Users across networked machines would impede with each other;
- Speedquery could 'hang' when operating on partially-updated databases

In common with all earlier versions, this version of Speedquery will **not** operate on C-ISAM databases.

This version of Speedquery will operate under the same versions of System Manager as version 3.0 Speedquery (see page 59 of the handbook); that is 6.1 & later plus recent 6.0 System Managers. It will operate with the same Speedbase databases as version 3.0; that is version 2.3 onwards (see page 59 of the handbook).

The documentation supplied with this version is identical to version 3.0 except there is a new document which is supplied to existing users only:

- MEQRV3.0H – Speedquery version 3.0H release notice.

Version 3.0 of Global 3000 Speedquery will be available for sale until 1st March 1993 and will be supported until 1st March 1994. Version 3.0H becomes the default on the weekend of 21st November 1992.
