

BULLETIN NUMBER GT584, 20 JANUARY 1993

## I-Servers running Unix System V Release 4

From mid 1990 a number of I-Server computers were sold for use with Global System Manager. Three operating systems were used on the I-Server:

- Unix System V release 4 – supplied with the I-Server
- SCO – either supplied with the I-Server or obtained independently by resellers
- BOS – supplied as part of System Manager

We understand that all the Unix System V release 4 I-Server sites have now been upgraded to use SCO. This bulletin is to announce that unless we receive information to the contrary the I-Server Unix System V release 4 System Manager will be dropped from the list of computers available for sale and supported from the 1st May 1993.

If you do have sites running Unix System 5 release V on the I-Server please let Martin Procter know immediately so that this notice can be rescinded and/or special arrangements made for support of the site/sites in question.

Thank you in advance for your cooperation.
