

# Repackaging of Global COMMS version 6.2

A repackaging of Global Communications V6.2 is now available. This new version of COMMS has been linked with the latest version of RESID\$ in order to fix problems whereby the computer could hang after exiting from COMMS. The following protocols have been repackaged:

TTY  
2780  
3780  
BOSLINK

In addition many small bug fixes have been made, and some specific enhancements as follows:

- The COMMS executive has been changed to produce extended XON/XOFF flow control for its own receive buffering in TTY COMMS. This is enabled by setting up COMMS option "F".
- There is a new COMMS option "!" which will cause the COMMS system always to execute the program RESET from the library P.BC when it exits back to BOS.
