

Global System Manager (Unix) for Apple A/UX

We are very pleased to announce the release of Global System Manager (Unix) V8.0 for A/UX release 3.0 on the Apple Quadra Series. Outline configuration details are as follows:

- System Manager is a Unix application; all peripheral devices (e.g. printers) are accessed via Unix. The Unix systems file determines the run-time configuration.
- *glconfig* is not supported on A/UX.
- Tape backup is performed from within the Unix operating system using the standard utilities provided. \$TAPE is not currently supported on A/UX.
- Systems for configuration C5526 are distributed on 3½" diskettes (both Global and non-Global format files).
- This is a 'LAN' system (as are all V8.0 Unix systems) and pricing is therefore LAN pricing. Configurations are available for price codes B to G inclusive (2 to 99 screens inclusive) and also for price code Z (9999 screens). All configurations require the XL System Manager or ML System Manager PM.
- The option to hold C-ISAM format Speedbase databases is not available for this configuration.
- We do not have a computer permanently at the London Development and support centre. We rely upon you, the reseller, reproducing problems on your computer. When we investigate problems, we have two alternatives:-
 - We access your computer via a modem (not possible for all types of problems); or
 - We visit the site at a mutually convenient time; such a visit would be chargeable.

Configuration notes C5526 should be ordered for more detailed information on the exact configuration.
