**BULLETIN NUMBER GT724, 29 NOVEMBER 1994**

# **Global System Manager (Unix) for Novell UnixWare**

We are pleased to announce the release of Global System Manager (Unix) V8.0 for Novell UnixWare V1.1 on the Intel 386 and 486 computers. Outline configuration details are as follows:-

- System Manager is a Unix application: all peripheral devices (e.g. printers) are accessed via Unix. The Unix systems file determines the run-time configuration.
- Global System Manager runs as a standard "USL Unix V Release 4.2 Version 1.1" application. The features of the UnixWare Open Desktop are not supported.
- Tape backup is performed from within the Unix operating system using the standard utilities provided. \$TAPE is not currently supported on UnixWare.
- Systems for configuration 5549 are distributed on QIC tape (both Global and non-Global format files).
- This is a LAN system (as are all V8.0 Unix systems) and pricing is therefore LAN pricing. Configurations are available for price codes B to G inclusive (2 to 99 screens inclusive) and also for price code Z (9999 screens). All configurations require the XL System Manager or ML System Manager PM.
- The option to hold C-ISAM format Speedbase databases is NOT available for this configuration.
- We do not have a computer permanently at the London Development and Support Centre. We rely upon you, the reseller, reproducing problems on your computer. When we investigate problems, we have two alternatives:-
  - We access your computer via a modem (not possible for all types of problems); or
  - We visit the site at a mutually convenient time; such a visit would be chargeable.

Configuration notes C5549 should be ordered for more detailed information on the exact configuration.
