BULLETIN NUMBER GT764, 4 JULY 1995

Global System Manager (Unix) for AIX V4.1

We are pleased to announce the release of Global System Manager (Unix) V8.0 for AIX V4.1 on the Motorola Power PC and IBM RS/6000. Outline configuration details are as follows:-

· Global System Manager is a Unix application: all peripheral devices (e.g. printers) are accessed via Unix. The Unix systems file determines the run-time configuration.

· Global System Manager runs as a standard AIX V4.1 application.

· Tape backup is performed from within the Unix operating system using the standard utilities provided although $TAPE is supported on AIX V4.1.

· Systems for configuration 5554 are distributed on QIC tape (both Global and non-Global format files).

· Systems for configuration 5557 are distributed on DAT tape (both Global and non-Global format files).

· This is a LAN system (as are all V8.0 Unix systems) and pricing is therefore LAN pricing. Configurations are available for price codes X to G inclusive (4 to 99 screens inclusive) and also for price code Z (9999 screens). All configurations require the XL System Manager or ML System Manager PM.

· The option to hold C-ISAM format Speedbase databases is NOT available for this configuration.

· We do not have a computer permanently at the London Development and Support Centre. We rely upon you, the reseller, reproducing problems on your computer. When we investigate problems, we have two alternatives:-

  · We access your computer via a modem (not possible for all types of problems); or

  · We visit the site at a mutually convenient time; such a visit would be chargeable.

Configuration notes C5554 or C5557 should be ordered for more detailed

information on the exact configuration.
